ONE-PIECE SERIES IMPLANTS INDEX

	NAME	MBI / MBI NC	Mono	Mono Bendable
TISSUE LEVEL IMPLANTS	BONE TYPES	All Bone Types		
	DESIGN FEATURES	• Apically tapered threads and tapered core body • Mini ball attachment prosthetic portion • Small diameter	• Tapered thread and tapered core body • Cementable prosthetic portion	• Tapered thread and tapered core body • Cementable prosthetic portion • Bendable neck
	CLINICAL BENEFITS	• Minimally invasive • Short and easy procedure minimal drilling • Suitable for implant and tissue supported denture • Self tapping • Immediate loading	• Tissue level implant • Bone condensing • High primary stability • Minimal drilling • Immediate loading	• Bone condensing • High primary stability • Minimal drilling • Immediate loading • Suitable for basal bone

ONE-PIECE DENTAL IMPLANTS (OPDI) SERIES

Noris Medical's One-piece dental implants (OPDI) have multiple advantages.

The main advantage is the One-Piece
The lack of the abutment/implant gap is significant in preventing bacterial contamination and crestal bone loss.

One-piece implants are cost-effective
When compared to conventional implants, as they eliminate the need for cover screws, healing abutments, subsequent separate implant attachments, separate implant abutments, or procedures that require time, effort and staff to attach or detach various prosthetic elements.

OPDIs eliminate the need for second-stage surgery
Mucosal healing period, and decrease patient exposure to additional unnecessary pain and discomfort.

OPDIs provide fast and minimally invasive replacement of missed teeth

Single piece implants are less invasive
Are either immediately loaded in case of good bone quality, or progressively loaded in case of less than ideal bone quality.

The implants are usually designed with
* Dense v-shaped or reverse buttress threads
* Calcium phosphate blasted surfaces, to achieve high primary stability when loaded immediately
* A thick smooth collar for soft tissue support

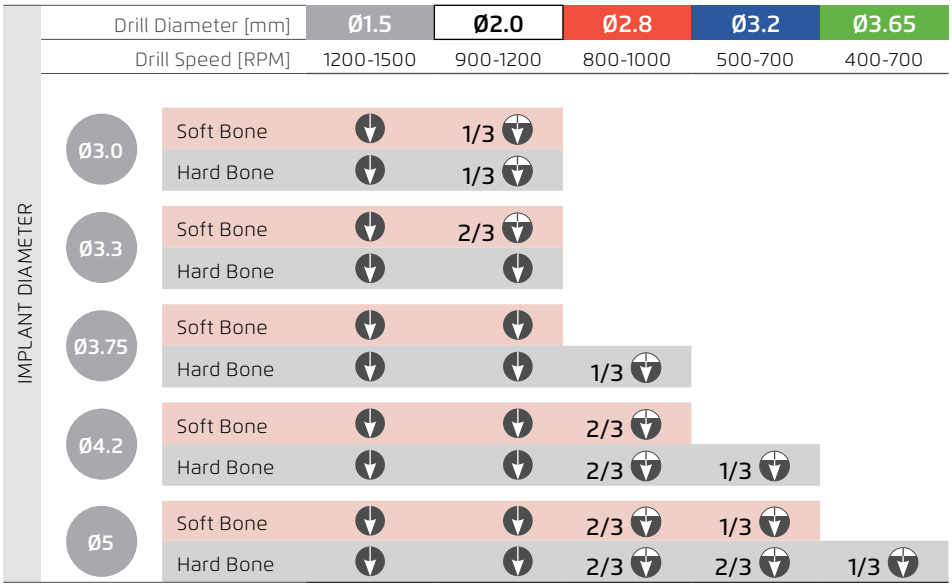
OPD Implants have wide versatility
The implants are provided with different abutment types for removable or cemented restorations and with a wide range of small and large diameters from 1.8 mm up to 5.0 mm.

Challenges with angulation could be avoided by digital planning or by the use of parallel pins after each drill so any deviation could be corrected with the subsequent drill, or by combining the slanted implant with an angled abutment. Mono Bendable provides the flexibility of an adjustable abutment element which can be oriented in any direction, and are cost-effective!

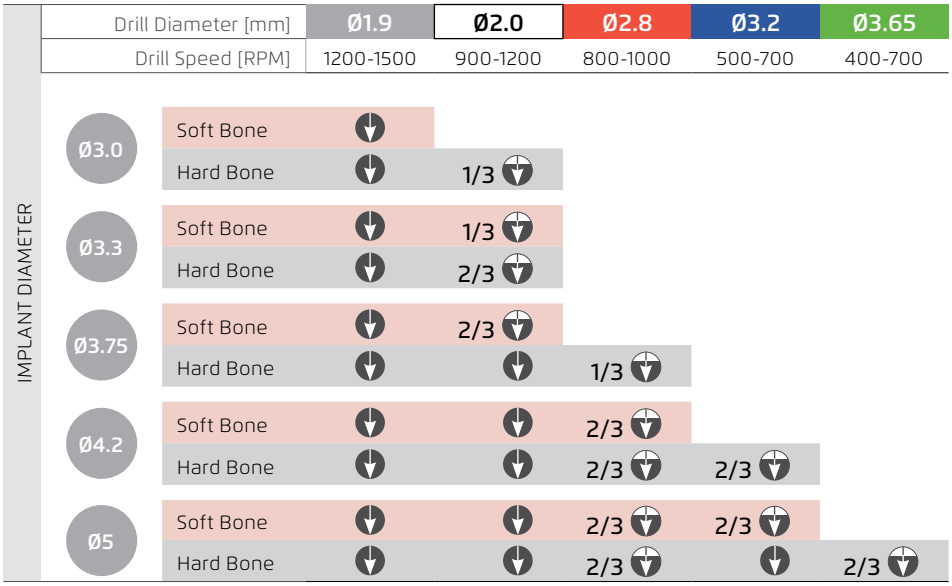
Single piece implants insertion protocol is learnable, easy to use and implement in everyday practice.

RECOMMENDED DRILL PROTOCOL

RECOMMENDED STRAIGHT DRILL PROTOCOL



RECOMMENDED STEP DRILL PROTOCOL



Drill to mark osteotomy site

Drill osteotomy to implant length

Drill osteotomy partially according to implant length

* The recommended drill protocol procedure should not replace the dentist's/surgeon's judgment.
The implants may be loaded for immediate function when good primary stability (above 35 Ncm) has been achieved and with appropriate occlusal loading.

CLINICAL CASE

One-piece implant with maximum accuracy

Bendable MONO implants are specifically used in basal bone on upper and lower jaws and are designed for immediate prosthetic loading for bridges and crowns at the anterior maxilla and mandible.

The implants are one-piece implants having an RBM treated bone condensing thread machined straight narrow collar and abutment.

A one-hour procedure performed by **Dr. Shlomo Birshan** with the exceptional "**Mono Bendable**" by Noris Medical.

IMMEDIATE EXTRACTION, IMPLANTATION, AND LOADING OF THE MANDIBULAR INCISORS. ALL DIGITAL!

The patient presented with mobile and periodontally involved mandibular incisors.
The plan was to remove the diseased teeth and immediately replace them with an implant-supported provisional bridge.
After the teeth were extracted, Noris Mono bendable implants were chosen. The thread design enables initial primary stability and the supracrestal segment has no gaps for micromotion or the need for prosthetic parts manipulation.
The smooth abutment neck is 1.8mm thick and allows one deflection of the neck, using a designated wrench, in order to align the abutment portion in a more prosthetically favorable position.
Once the position of the abutment was optimized, the abutments were scanned using a digital intraoral scanner in order to fabricate a provisional bridge.
The Noris Mono machined neck provides excellent support for the sulcular soft tissue.
The patient is expected to return for the final restoration. No major soft tissue changes are expected thus the original scan can be used for final restoration fabrication.
